This eLamp has lots of text in it at a very small size, yet that text can be made larger by enlarging the view of the eLamp. So, using a custom eLamp in this manner can be a very effective way of including a large amount of text in a eLamp yet keeping the default view of the eLamp not very large. This text is set at 4 point, yet the information necessary to display the font correctly at larger sizes is available within the pdf automatically as it is stored independently of font display size
